

Food security and health: making the connections

Amber Canto, MPH, RD

Poverty and Food Security Specialist

University of WI-Extension, Cooperative
Extension

Defining food security

Food security:

access by all people at all times to enough food for an active and healthy life

Food insecurity:

uncertain or limited access to enough food for an active and healthy life

■ Food secure ■ Low food security ■ Very low food security

Hunger is an individual-level physiological condition that may result from food insecurity.

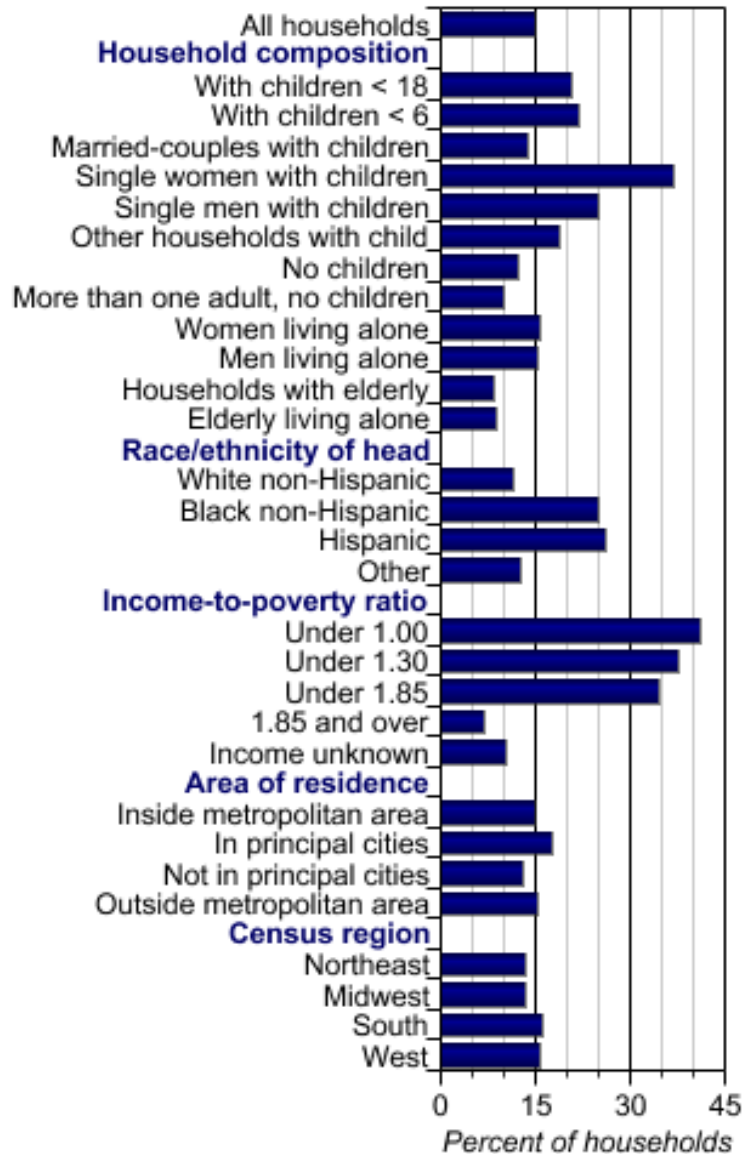

Source: Calculated by ERS using data from the December 2012 Current Population Survey Food Security Supplement.

Food Insecurity Trends in Wisconsin

- Food insecurity in Wisconsin increased by over 30% during Great Recession
- Trend is similar to nationwide, though Wisconsin rates are lower
- Data don't allow year-to-year trend
- Harder to learn about within-state variation

Prevalence of food insecurity, 2011

Who is at risk for food insecurity?

- Groups at higher-than-average risk of food insecurity nationally:
 - Households with incomes below FPL
 - Single headed households with children
 - Black households
 - Hispanic households

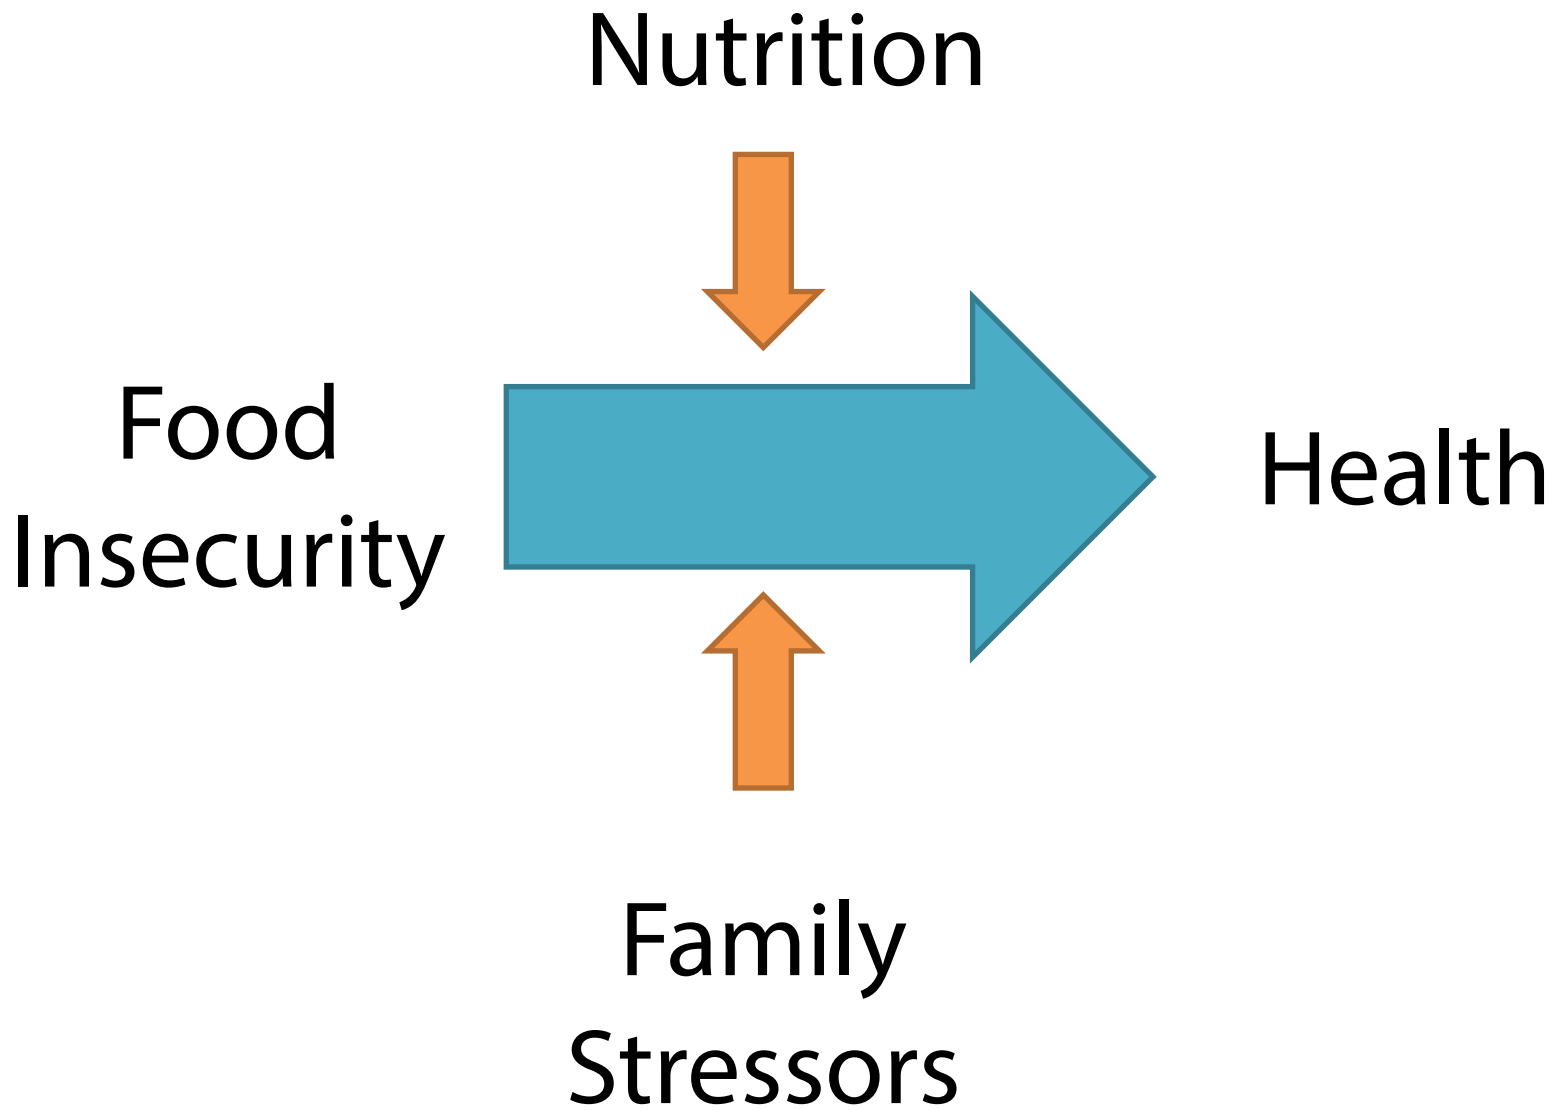

How Poverty Impacts Health

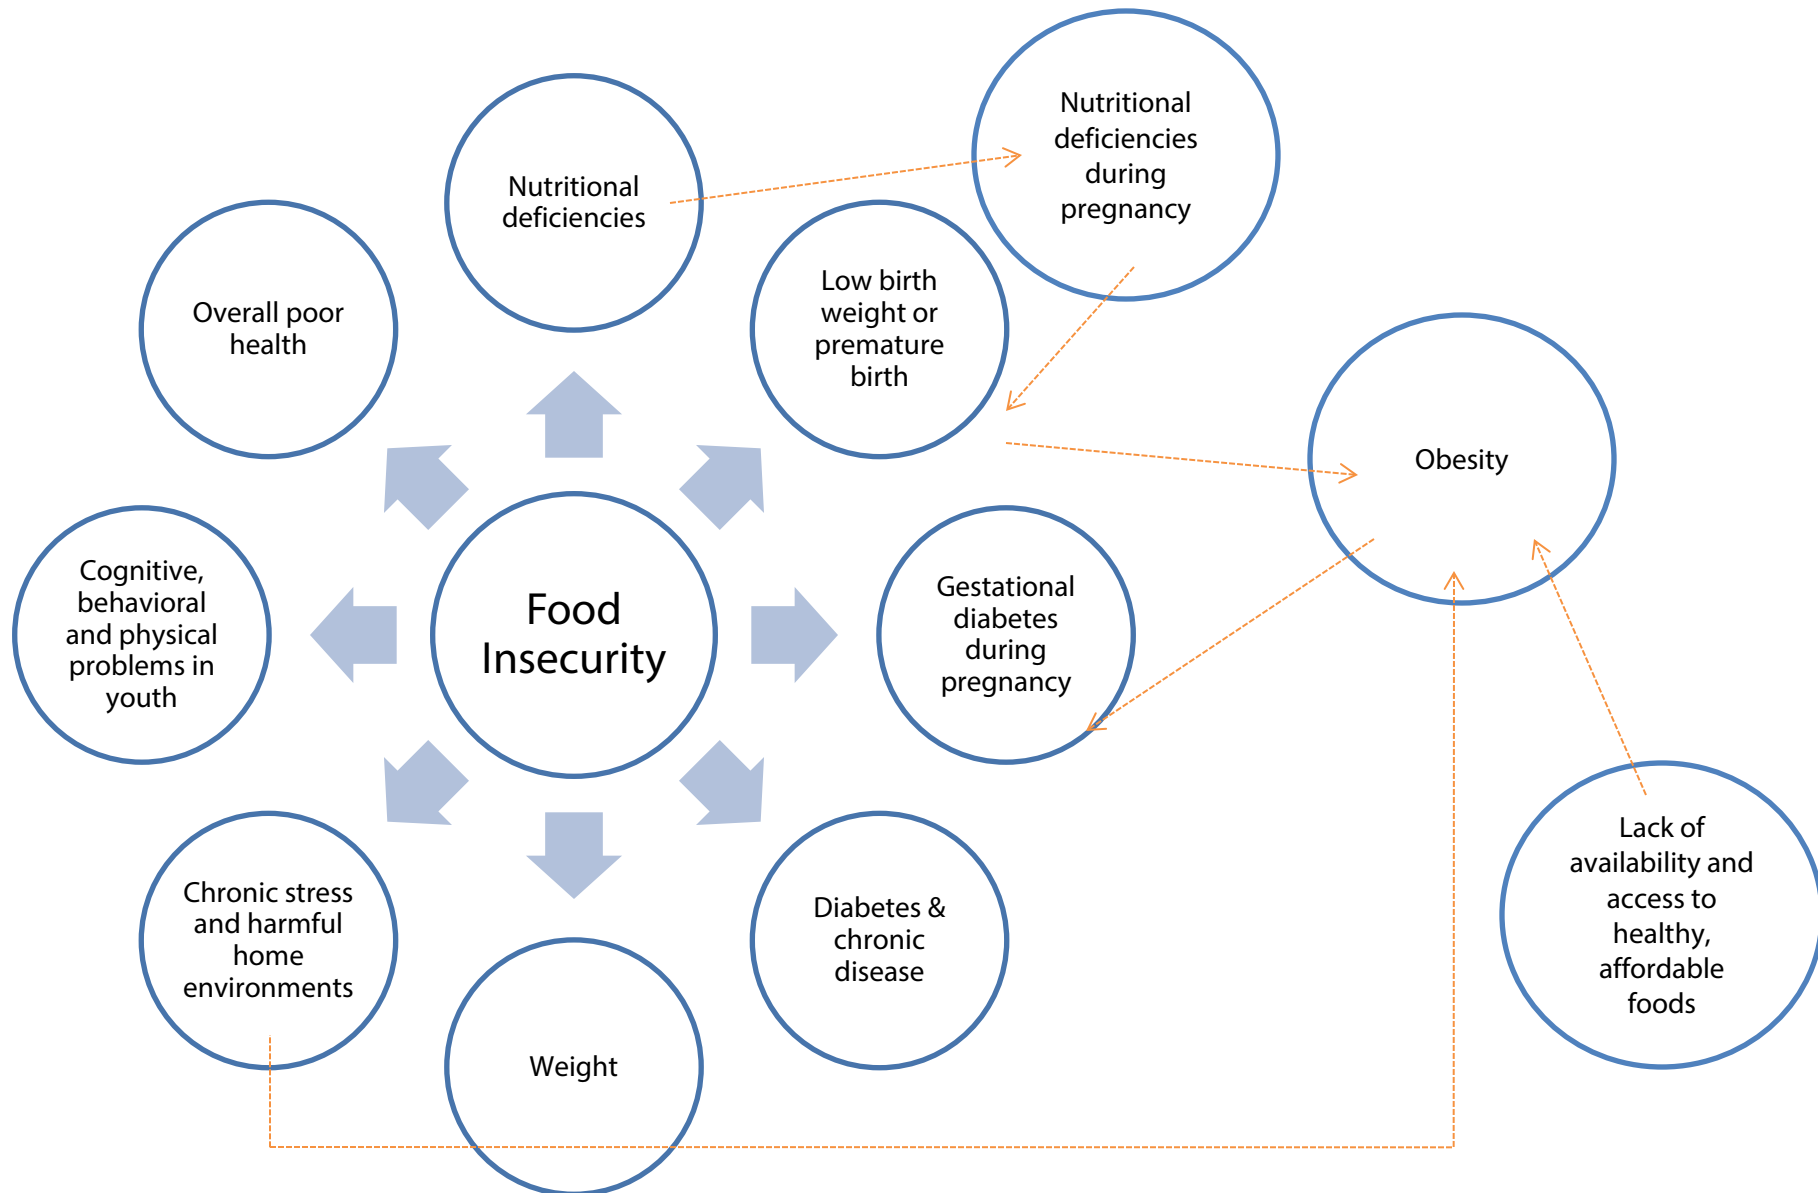

The cyclical effects of poverty

Figure 11. Health is transmitted by social factors across lifetimes and generations

Braveman et al / Am J Prev Med 2011;40(1S1):S4-S18

Connecting Food Insecurity to Health

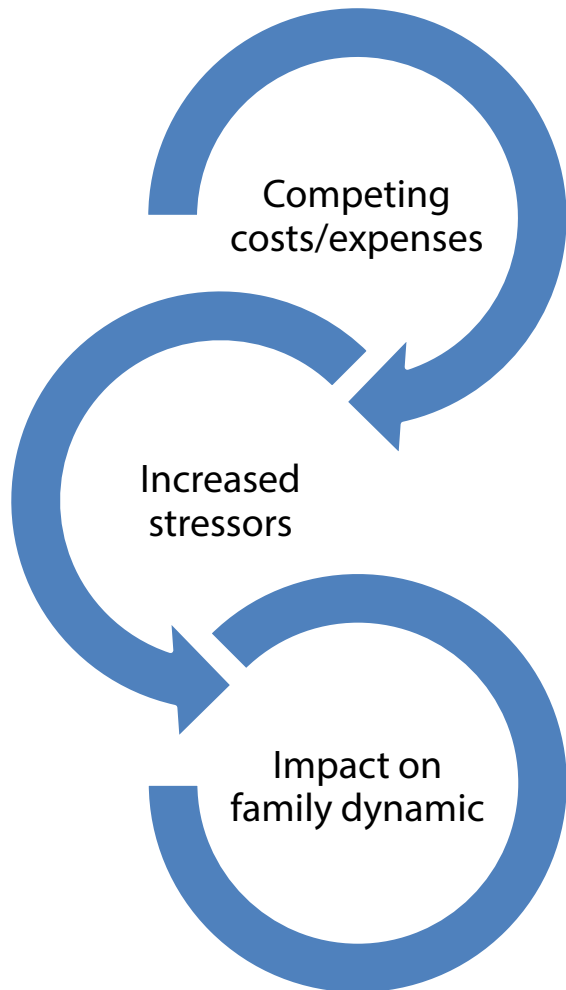

Food Insecurity, Child Health & Development

Children in food insecure households are more likely to:

- **Have poor health** (Cook et al., 2004; Weinreb et al.; Dunifon and Kowaleski-Jones, 2003; Alaimo et al., 2001)
- **Psychosocial problems** (Kleinman et al., 1998; Weinreb et al., 2002; Murphy et al., 1998; Casey et al., 2005)
- **Frequent stomachaches and headaches** (Alaimo et al., 2001)
- **Behavior problems** (Slack and Yoo, 2005; Whitaker et al., 2006)
- **Worse developmental outcomes** (Jyoti et al., 2005; Rose-Jacobs et al., 2008)
- **More chronic illnesses** (Weinreb et al., 2002)
- **Impaired functioning** (Murphy et al., 1998)
- **Higher levels of iron deficiency with anemia** (Skalicky et al., 2006; Alaimo et al., 2001)

Family Stress Model

Healthy Families in Hard Times Report

Children with moderate hardship (v. those with no hardship) were:

- 11% more likely to be classified as well
- 21% more likely to be at risk for developmental delay

Children with severe hardship (v. those with no hardship) were:

- 35% less likely to be classified as well
- 120% more likely to be at risk of developmental delay

Food insecure *and* obese?

- Growing body of literature primarily based on cross-sectional studies, limited availability of longitudinal studies
 - Difficult to determine causal relationship
- Most consistent findings suggest relationship of food insecurity and risk for obesity among **women**...children (mixed evidence) and adolescents (growing evidence)
 - Maternal stress/depression
 - Disruptive eating patterns (cycles of deprivation/overeating & sacrifice food supply)
 - Consumption of low-cost, poor-quality foods

Food Insecurity & Overweight/Obesity in Children

- Children in FISH greater risk for overweight BMI for 12-17 y/o, girls, white, and in households with income <FPL. NHANES 99-02 (Casey et al., 2006)
- Among 3-10 y/o, food insecurity and maternal stressors significantly linked to probability of being overweight. No association from 11-17 y/o. NHANES 99-02 (Gunderson et al., 2008)
- Food insecurity indirectly influenced 2 y/o overweight through parenting practices and infant feeding (Bronte-Tinkew et al, 2007)
- **No associations found** (Bhargava et al., 2008; Bhattacharya, et al., 2004; Feinberg., 2008; Gunderson et al., 2008; Gunderson et al., 2009; Kaiser et al., 2002; Martin et al., 2007; Rose et al., 2006; Whitaker et al., 2006; Winicki et al., 2003)

Critical Shared Risk Factors Among Obesity and Food Insecurity

- Social determinants of health
 - Poverty
 - Race/Ethnicity
 - Education Level
- Access to and availability of affordable, healthy food
